PET in Systemic Lymphomas-Surveillance

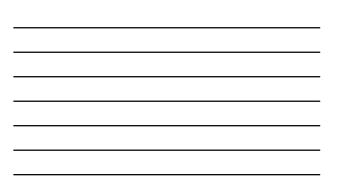

Summary and recommendations

- No survival advantage with the use of surveillance imaging for patients with DLBCL or HL who achieved remission after first-line therapy.
- Surveillance imaging produces additional radiation exposure.
- Recommend that patients with HL and DLBCL who achieve CR should not receive routine surveillance imaging(Lugano2014)- grade IB recommendation

Meta-Analysis – NK T cell Lymphomas (Take Home message)

Upfront RT confers survival advantage over late RT in the combined modality therapy.

 upfront RT may not have any advantage in complete response rates over late RT in the combined modality.

 Combination therapy has better clinical outcomes as compared to single modality (RT or chemotherapy alone)

Thank you!
