Evaluation, Risk-based Stratification & Molecular Classification in Endometrial Cancer

DR ABHISHEK SHINGHAL
MAHAMANA PANDIT MADAN MOHAN MALAVIYA CANCER CENTRE &
HOMI BHABHA CANCER HOSPITAL, VARANASI
(Units of Tata Memorial Centre, Mumbai. Grant-in-Aid Institute of Dept. of Atomic Energy)

Burden of Disease

- Endometrial cancer most common Gynecologic malignancy in high-income countries with Age-standardized incidence of 8.7 per 100,000 females (1).
- In India it is the second most common Gynecological malignancy with 16,413 new cases and 6,385 deaths every year (1).
- The incidence peaks between ages 60 and 70 years, but 2 to 5 percent of cases occur before age 40 years (2).

Risk Factors

Estrogen related factors:	Other
1. Early menarche <12- RR- 2.4	1. Advanced age >60
2. Late menopause >55- RR- 1.8	2.Lynch syndrome/ Hereditary non polyposis colon cancer (HNPCC)- 40-60%
3. Nulliparity or history of infertility –RR-3	3. T2 Diabetes – RR-2.1
4. Use of tamoxifen in postmenopausal women- RR-4	4. Metabolic syndrome – RR – 1.89
5. Unopposed estrogen therapy (10-30 fold)	5. overweight/ Obesity – RR- 1.32/2.21
6. Estrogen secreting tumors (Granulosa & thecal cell tumors of ovary)	6. Hypertension – RR- 1.81
7.Polycystic ovarian disease- RR- 2.79	7.Family history of endometrial cancer
8. Liver cirrhosis	8. Prior pelvic irradiation

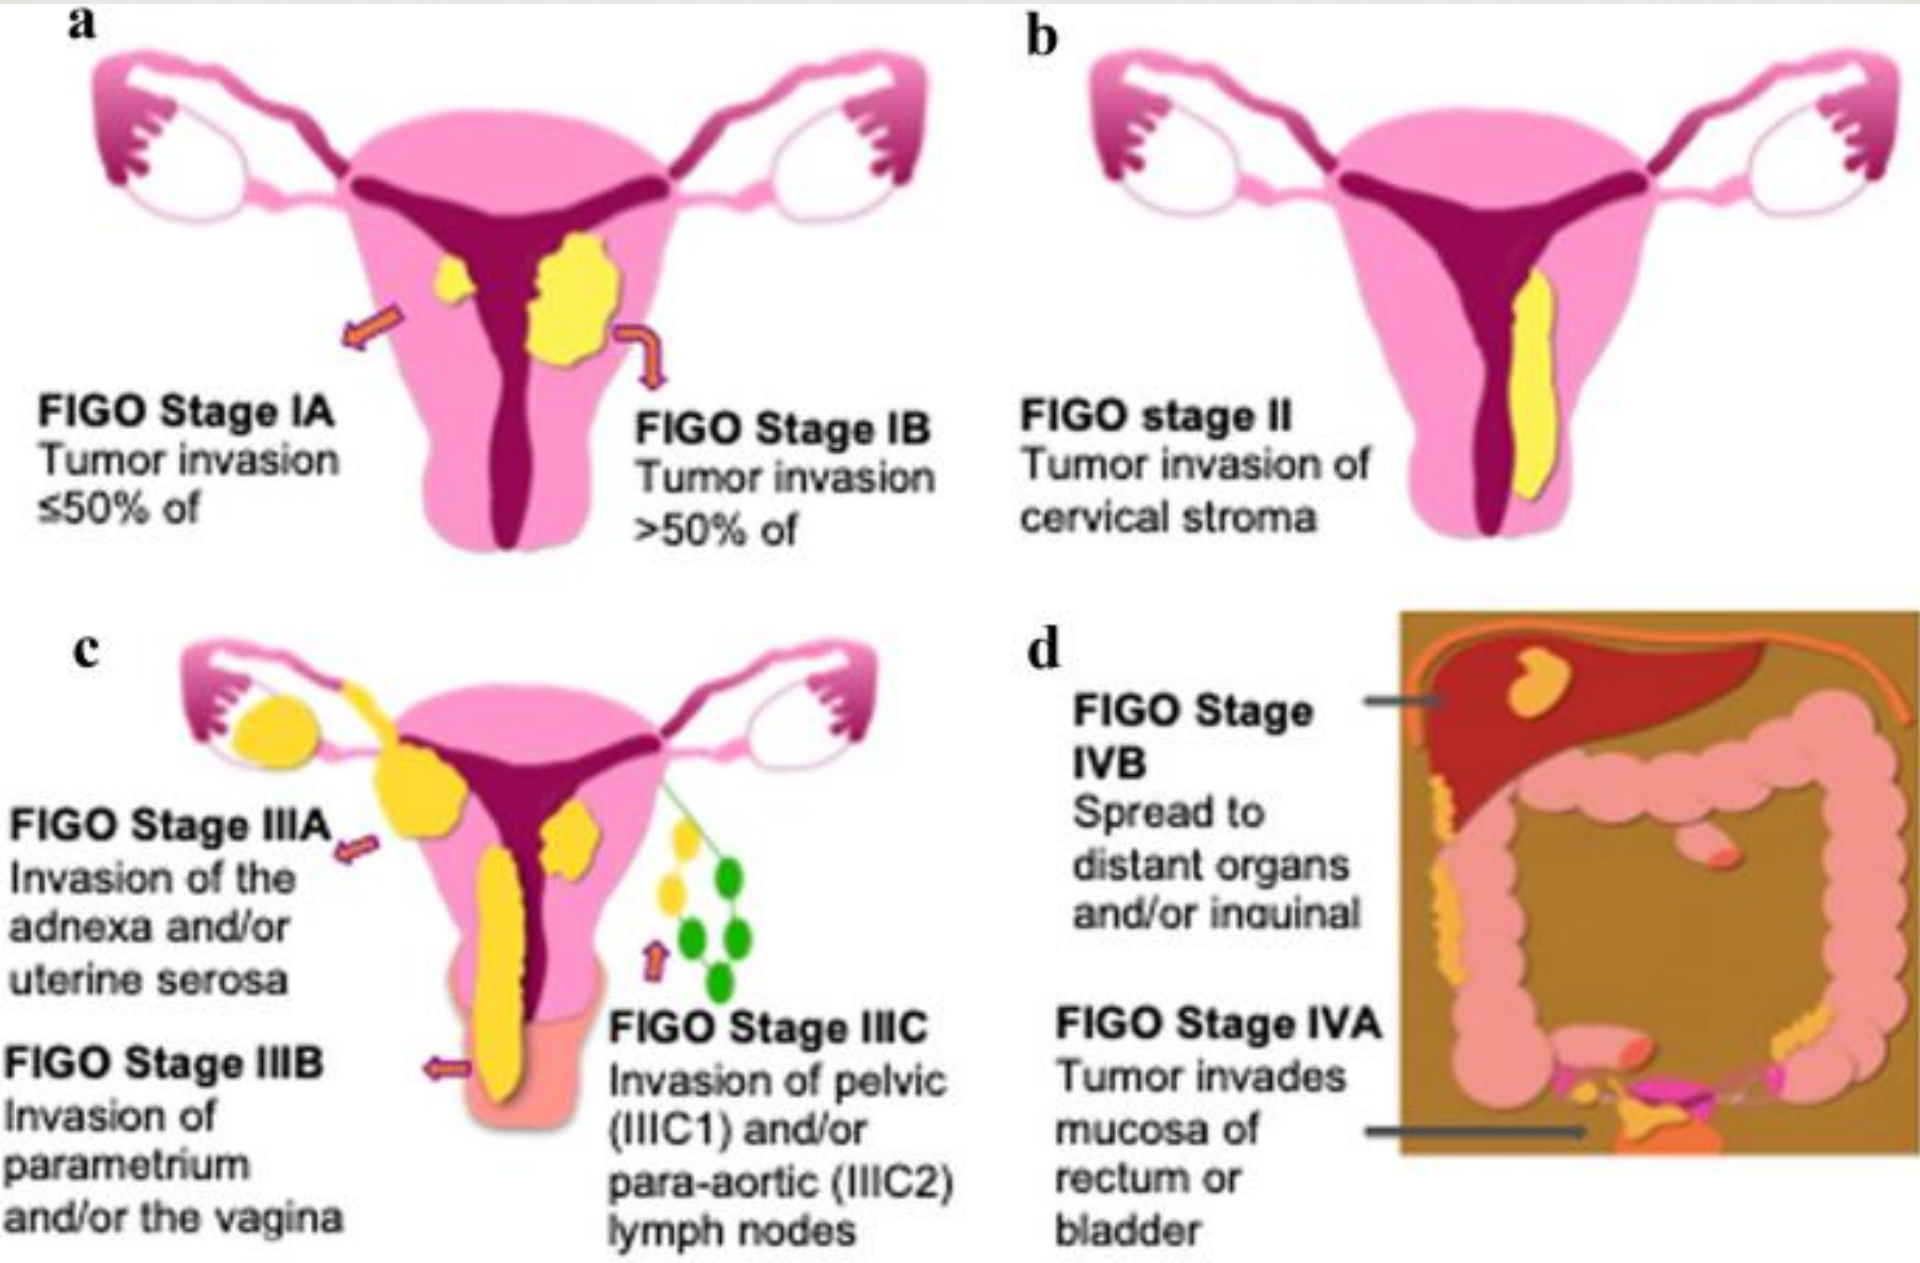
Staging in Endometrial Cancer



Histological Classification

Uterine Carcinomas:

- Endometrioid adenocarcinomas (75-80%)
  - Villoglandular
  - Adenoacanthoma (adenoca with benign squamous elements)
  - Secretory
  - Ciliated
- Mucinous adenocarcinoma
- Papillary serous adenoca (1-5%)
- Clear cell adenocarcinoma (5-10%)
- Squamous cell carcinoma
- Undifferentiated carcinoma

Uterine Sarcomas: (3%)

- Leiomyosarcoma
- Endometrial stromal sarcoma
- Adenosarcoma
- Carcinosarcoma (Malignant Mixed Mullerian Tumour/ MMMT)

Histological Grading

FIGO histological grading is based on degree of differentiation:

G1 : ≤ 5% non squamous or non morular solid growth pattern

G2 : 6–50% non squamous or non morular solid growth pattern

G3 : >50% non squamous or non morular solid growth pattern

GX : Grade cannot be assessed

G1 : Well differentiated

G2 : Moderately differentiated

G3 : Poorly differentiated or undifferentiated

High risk histology:

Serous, clear cell and

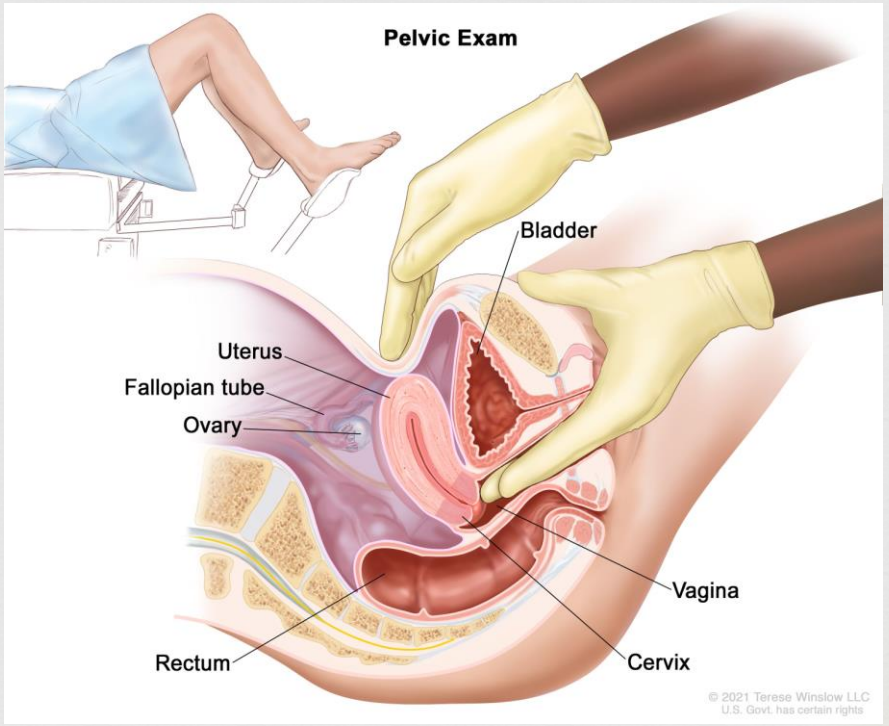
MMMTs- *high risk* – Grade 3

Clinical Presentation

- Abnormal Uterine Bleeding
  present in 75 to 90 percent of cases.
- Abnormal Cervical Cytology
- Incidental finding on Imaging
- Incidental finding after hysterectomy or during abdominopelvic surgery

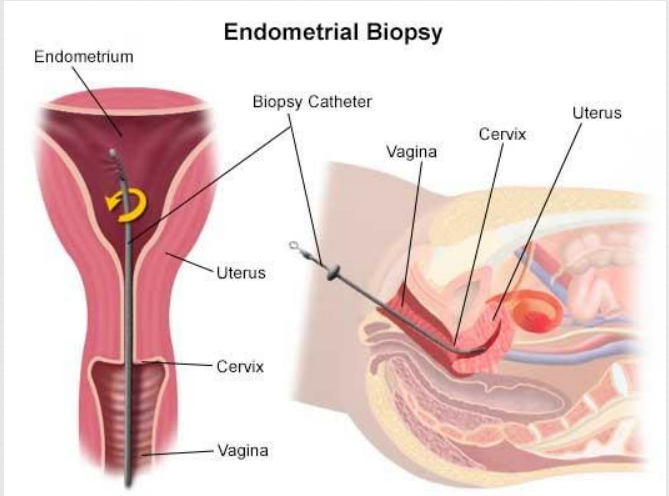
Evaluation

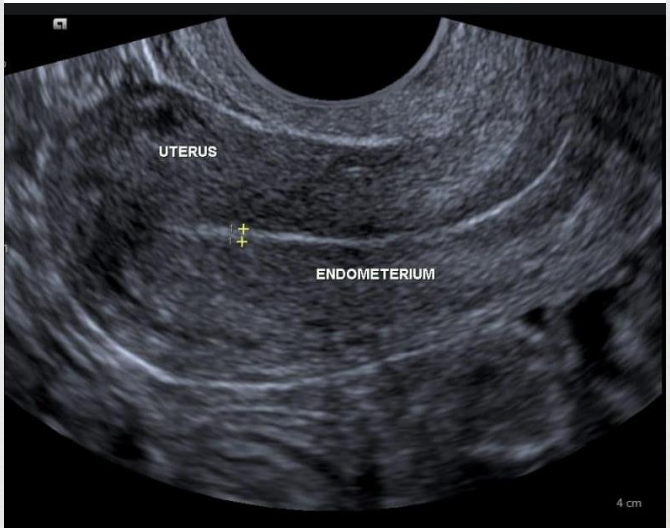
- History ,Physical examination, including bimanual pelvic and bidigital examination
- Assessing baseline fitness of patient:
  - Routine blood investigations
  - Chest X Ray



Establish Diagnosis

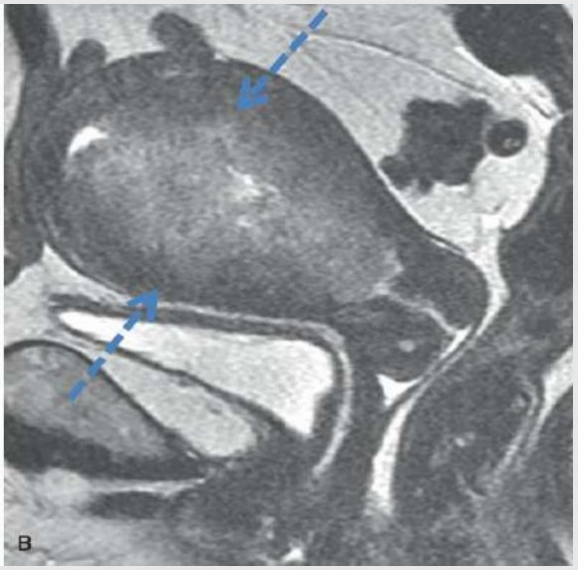
- TVS
  - 5mm thickness in post menopausal women – abnormal
  - Sensitivity of 96%
  - Premenopausal women - endometrial thickness fluctuates with hormone levels
- Endometrial tissue sampling- Gold std
  - Biopsy- Pippelle (Sensitivity 91% in premenopausal, 99.6% in postmenopausal)- OPD Biopsy
  - D and C- Not routinely required if patient is asymptomatic and is planned for surgery
- Hysteroscopy Biopsy
  - If TVS is abnormal but biopsy is inconclusive





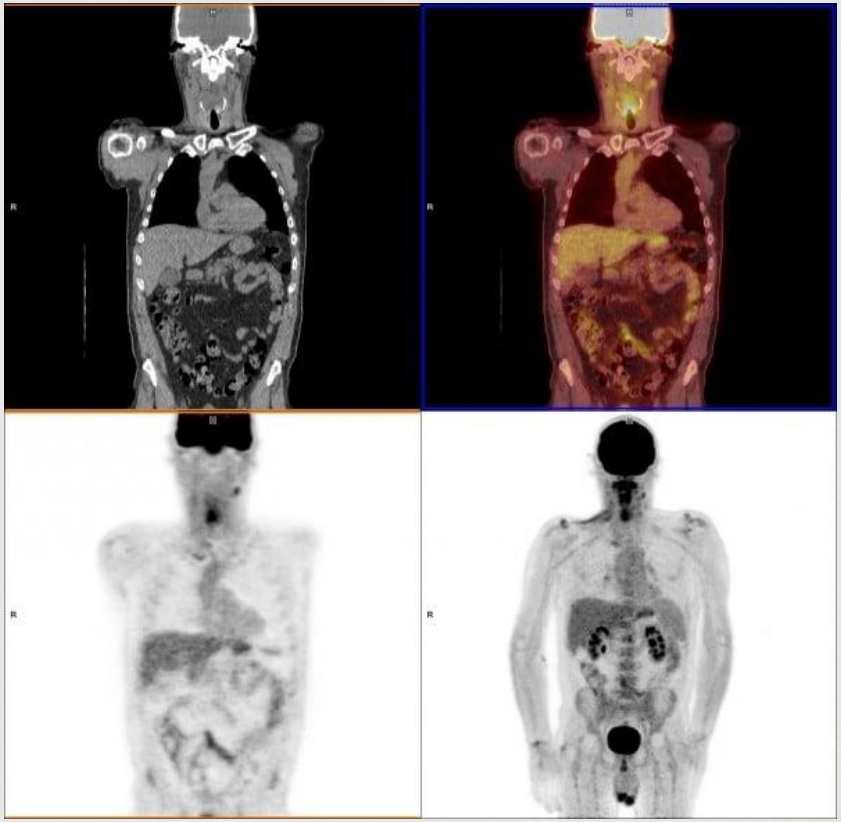
Staging

- MRI Pelvis:
  - For determining extent of myometrial invasion
  - To delineate cervical stromal involvement
  - Prior to fertility sparing treatment
  - To rule out residual disease (post incomplete surgery)
  - Status of Pelvis Lymphadenopathy
- CECT Thorax + Abdomen
  - In advanced stages (To rule out distant metastasis).



Additional tests

- PET CECT:
  - In advanced stages
  - LN/ Distant mets
  - Recurrent disease
  - Disadvantage – if <5mm sensitivity is as low as 12%
- CA -125 :
  - Could be elevated in patients with Ca Endometrium
  - Not routinely done
  - Preop levels >40U/mL → s/o regional LN mets and can be used as an indication for full pelvic/ PALND in the absence of metastatic disease.



MRI, PET/CT and ultrasound in the preoperative staging of endometrial cancer — A multicenter prospective comparative study

Sofie Leisby Antonsen [a,*], Lisa Neerup Jensen [b], Annika Loft [c], Anne Kiil Berthelsen [c], Junia Costa [c], Ann Tabor [b,o], Ingelise Qvist [d], Mette Rodi Hansen [e], Rune Fisker [f], Erik Søgaard Andersen [g], Lene Sperling [h], Anne Lerberg Nielsen [i], Jon Asmussen [j], Estrid Høgdall [k], Carsten L. Fagö-Olsen [a], Ib Jarle Christensen [l], Lotte Nedergaard [m], Kirsten Jochumsen [n], Claus Høgdall [o]

Models for optimizing predictive value of myometrial invasion, cervical invasion and lymph node metastases in endometrial cancer patients.

Imaging	Sensitivity (%)	Specificity (%)	PPV (%)	NPV (%)	Accuracy (%)
Myometrial invasion					
PET/CT + MRI + 2DUS	100	27.8	38.7	100	50.4
PET/CT + MRI	100	35.1	37.0	100	53.0
PET/CT + 2DUS	95.7	35.7	41.7	94.6	55.2
MRI + 2DUS	95.7	45.2	43.6	95.9	60.7
Cervical invasion					
PET/CT + MRI + 2DUS	46.2	81.3	40.0	84.8	73.8
PET/CT + MRI	51.3	89.8	55.6	88.1	82.1
PET/CT + 2DUS	45.2	86.8	48.7	85.2	77.8
MRI + 2DUS	40.5	87.5	47.2	84.2	77.3
Lymph node metastases					
PET/CT + MRI	85.7	88.2	37.5	98.8	88.6

PPV: positive predictive value, NPV: negative predictive value.

Surgical Staging

Surgery - mainstay of treatment

- Extrafascial total hysterectomy with bilateral salpingo-ophorectomy
  - Inspection of the pelvic & abdominal cavities
  - Biopsy of any suspicious extrauterine lesions
  - Peritoneal washings in most cases
  - Surgical assessment of lymph nodes ranges
    - Palpation and Biopsy of suspicious nodes
    - Sentinel lymph node biopsy / Pelvic +/- para-aortic lymphadenectomy
  - Omental bx – in clear cell / serous carcinoma and carcinosarcoma histologies

Risk based Stratification

Need to identify patients with higher chances of local and/or distant recurrences.

In 1983 Bokhran described two risk types:

- Type 1 EC
  - Comprise 65% of EC
  - Estrogen driven
  - Lower grade or endometrioid histologies
  - Favourable prognosis

- Type 2 EC
  - Clinically aggressive histologies
  - Diverse mix of high grade histologies
  - Poor treatment outcomes

Could not capture biological diversity and clinical outcomes of all histologies

RSS	Low	Low Intermediate	High Intermediate	High
PORTEC-1-2000	Stage Ia, grade 1	Stage I with Gr 1 and MMI⩾50% , Gr 2 with any MMI Gr 3 with MMI <50%	Age >60 years with Gr 1 or 2 and MMI >50% Age >60 with Gr 3 and MMI <50%	Stage III–IV disease Uterine serous carcinoma or clear cell carcinoma of any stage

ESMO-ESGO-ESTRO Consensus Conference on Endometrial Cancer

Diagnosis, Treatment and Follow-up

Nicoletta Colombo, Carien Creutzberg,† Frederic Amant,‡ Tjalling Bosse,§ Antonio González-Martín,|| Jonathan Ledermann,¶ Christian Marth,# Remi Nout,** Denis Querleu,†† Mansoor Raza Mirza,‡‡ Cristiana Sessa,§§ and the ESMO-ESGO-ESTRO Endometrial Consensus Conference Working Group*

Risk stratification	Factors
Low risk	Stage I endometrioid, grade 1–2
Intermediate low risk	Stage I endometrioid, grade 1–2, ≥50% MMI, LVSI negative
Intermediate high risk	Stage I endometrioid, grade 3, <50% MMI, regardless of LVSI status Stage I endometrioid, grade 1–2, LVSI unequivocally positive, regardless of DOI
High risk	Stage I endometrioid, grade 3, ≥50% MMI, regardless of LVSI status Stage II, Stage III endometrioid, no residual disease Non-endometrioid

International Journal of Gynecological Cancer • Volume 26, Number 1, January 2016

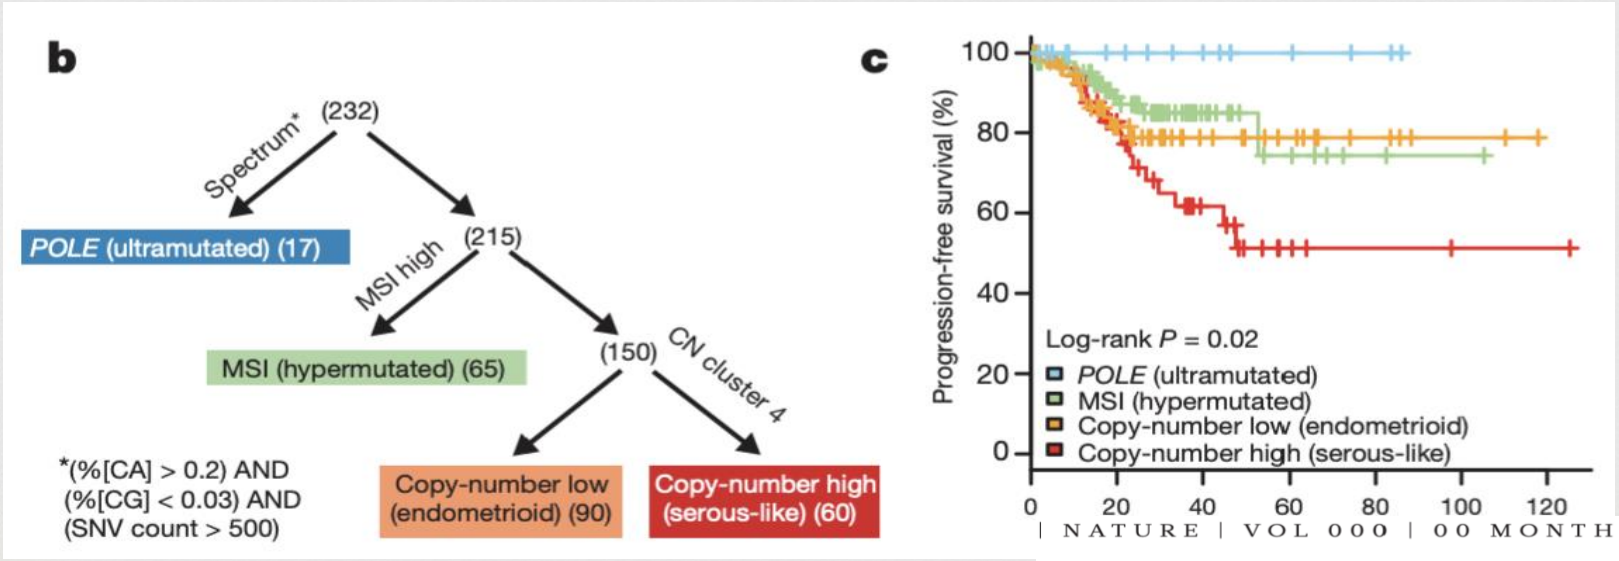
Caveats of Histo-morphological Classification

- Grade and stage migration from endometrial biopsy to hysterectomy specimens in 15-30% of patients (3,4).
- Identifying patients requiring adjuvant therapy remain a tremendous challenge.
- Histologic subtype assignment having moderate concordance among pathologists ranging from 60-70% only (5,6).
- Poor reproducibility in identifying multiple pathologic features
- Need for bringing more reproducibility and objectivity

Integrated genomic characterization of endometrial carcinoma

The Cancer Genome Atlas Research Network*

Group	POLE ultramutated	MSI hypermutated	Copy-number low	Copy-number high
Histology		Primarily endometrioid histology		Most serous/mixed histology tumors and 25% of grade 3 endometrioid tumors
Group identity	POLE exosome domain mutation (100%)	MSI (*MLH1* gene hypermethylation)	Low SCNAs	High SCNAs
Characteristic	Low SCNAs	Low SCNAs	High frequency CTNNB1, SOX17, KRAS, β-catenin mutations	High frequency TP53, ERBB2, CDKN2A mutations and low PTEN expression
	High mutation rate (232×10^{-6}/Mb)	High mutation rate (18×10^{-6}/Mb)	Low mutation rate (2.9×10^{-6}/Mb)	Low mutation rate (2.3×10^{-6}/Mb)
Outcome	Better OS and PFS			Poor OS and PFS



Disadvantages of TCGA Classification

- Needed Fresh frozen tissue for analysis
- Gene sequencing was an integral part of the analysis
- Logistic and Financial constraints for its global implementation

Final validation of the ProMisE molecular classifier for endometrial carcinoma in a large population-based case series

S. Kommoss[1], M. K. McConechy[2], F. Kommoss[3], S. Leung[4], A. Bunz[1], J. Magrill[5], H. Britton[5], F. Kommoss[1,6], F. Grevenkamp[1], A. Karnezis[5], W. Yang[5], A. Lum[5], B. Krämer[1], F. Taran[1], A. Staebler[7], S. Lax[8], S. Y. Brucker[1], D. G. Huntsman[5], C. B. Gilks[5], J. N. McAlpine[9,*†] & A. Talhouk[5†]

- More practical classification
- Could be done on standard formalin fixed and paraffin embedded samples
- Used Immunohistochemistry tests (Except POLE EDM) for testing which serves as surrogate for TCGA classification

Annals of Oncology 29: 1180–1188, 2018
doi:10.1093/annonc/mdy058
Published online 7 February 2018

DNA Polymerase epsilon (POLE) mutated

- These are Copy number (CN) stable EC
- Recurrent mutations in exonuclease domain of POLE gene
- Highest somatic mutation frequencies exceeding 100 mutations per megabase (Mb)
- Mostly of endometrioid histologic type
- Excellent prognosis with 5-year OS exceeding 95%

Mismatch repair deficient (MMRd)

- MMR proteins constitutes: mutL homolog 1 [MLH1], postmeiotic segregation 2 [PMS2], mutS homolog 2 [MSH2], or mutS homolog 6 [MSH6]
- Epigenetic silencing of MLH1 contributes to majority of this subtype
- Lower levels of somatic Copy-number alterations but a high tumor mutational frequency (>10 mutations/Mb)
- Includes both somatic and germline mutations (Lynch syndrome)

p53 wild-type (p53wt)

- Genomically stable with moderate mutational load EC
- Involves mostly endometrioid histology with estrogen and progesterone receptor positivity ensuring high response to hormonal therapy
- Has Intermediate to Favorable prognosis

p53 abnormal (p53abn)

- TP53 mutation characteristic of this group
- Has high somatic Copy-number alterations and mutation profiles
- Associated with worse prognosis accounting for 50-70% of endometrial cancer mortality

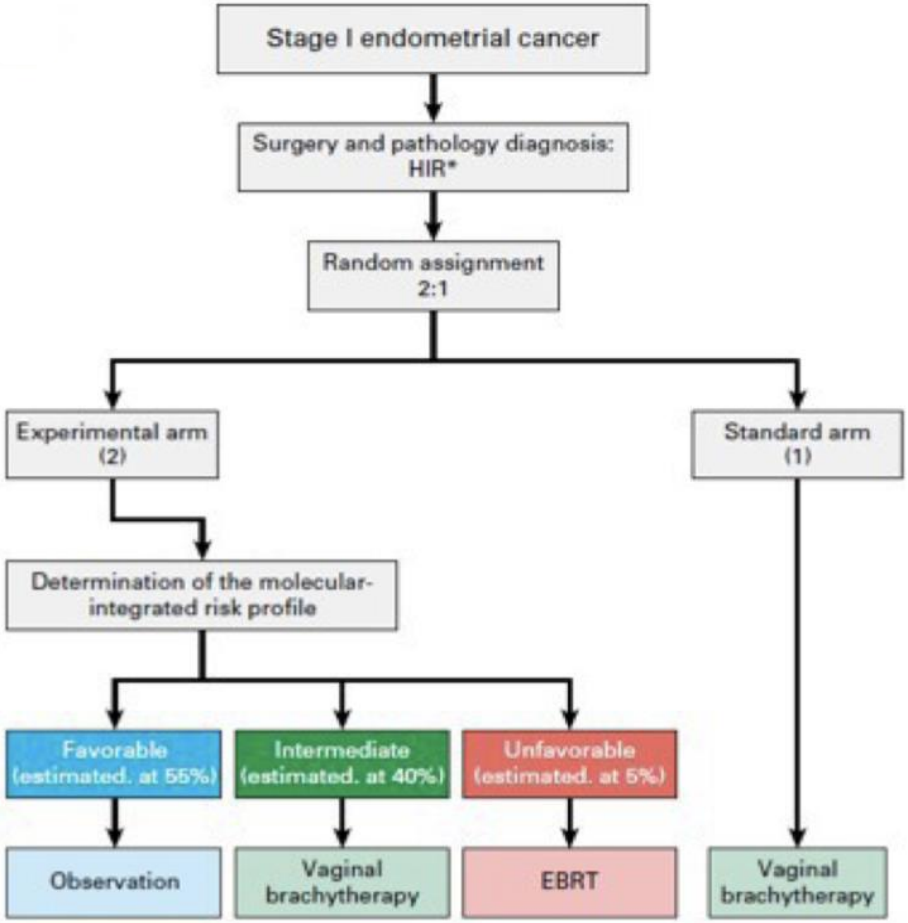
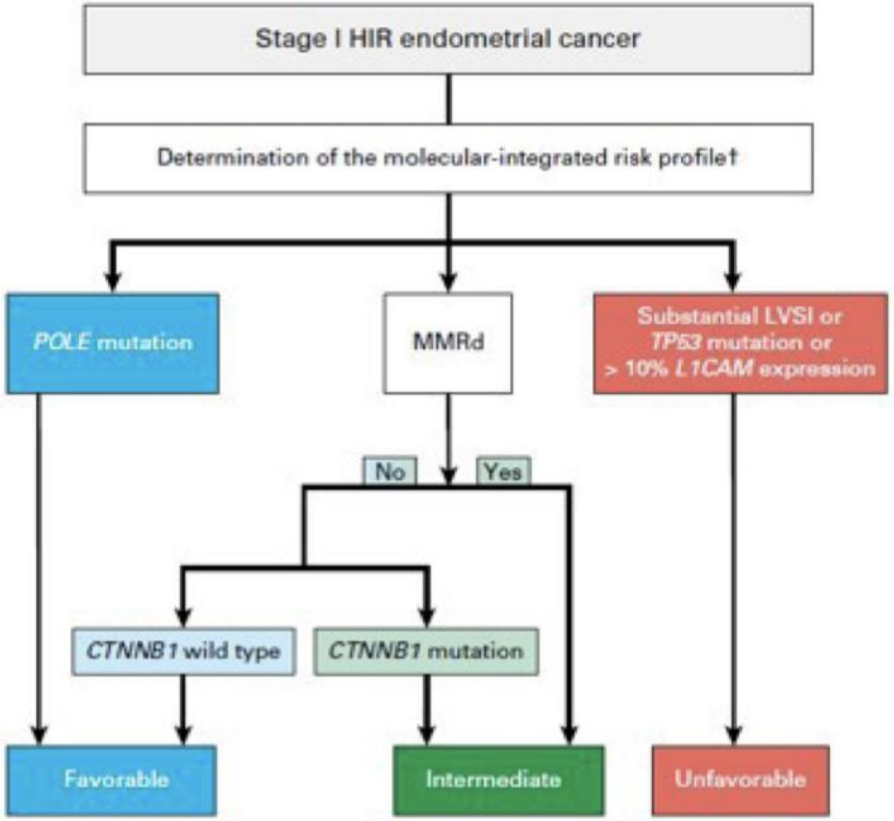
ClinicalTrials.gov Identifier: NCT04705649

molecular profile-based adjuvant treatment for women with high-intermediate risk endometrial cancer





van den Heerik ASVM, *et al. Int J Gynecol Cancer* 2020;**30**:2002–2007. doi:10.1136/ijgc-2020-001929

Current impact of Molecular Markers

- Molecular markers introducing more objectivity
- Validation and reliability in Prognostic setting
- Data emerging in its usage as Predictive factor
- Multi institutional collaborative studies needed further for its validation and adaptation in Indian setting
