

# Designing a Clinical Trial in Oncology

Dr Supriya Mallick  
Associate Professor  
National Cancer Institute  
AIIMS

# The UK Standardisation of Breast Radiotherapy (START) trials of radiotherapy hypofractionation for treatment of early breast cancer: 10-year follow-up results of two randomised controlled trials

Joanne S Haviland, J Roger Owen, John A Dewar, Rajiv K Agrawal, Jane Barrett, Peter J Barrett-Lee, H Jane Dobbs, Penelope Hopwood, Pat A Lawton, Brian J Magee, Judith Mills, Sandra Simmons, Mark A Sydenham, Karen Venables, Judith M Bliss\*, John R Yarnold\*, on behalf of the START Trialists' Group†

## Hypofractionated versus conventional fractionated postmastectomy radiotherapy for patients with high-risk breast cancer: a randomised, non-inferiority, open-label, phase 3 trial

Shu-Lian Wang\*, Hui Fang\*, Yang-Wen Song, Wei-Hu Wang, Chen Hu, Yue-Ping Liu, Jing Jin, Xin-Fan Liu, Zi-Hao Yu, Hua Ren, Ning Li, Ning-Ning Lu, Yu Tang, Yuan Tang, Shu-Nan Qi, Guang-Yi Sun, Ran Pema, Shuai Li, Bo Chen, Yana Yana, Ye-Xiao Li

**Not different between CFRT and HFRT**

## Ten-Year Results of FAST: A Randomized Controlled Trial of 5-Fraction Whole-Breast Radiotherapy for Early Breast Cancer

Systematic review and meta-analysis comparing hypofractionated

- HFRT cost one-third lower than CFRT
- Decreased grade 2/3 acute skin reactions
- HFRT 2.5-3.0 Gy /# significantly decreased moderate/marked photographic changes

## 5-Fraction Whole-Breast Radiotherapy for 1 week versus Standard Fractionation (FAST-Forward): 5-year efficacy and late normal tissue effects results from a multicentre, non-inferiority, randomised, phase 3 trial

Adrian Murray Brunt\*, Joanne S Haviland\*, Duncan A Wheatley, Mark A Sydenham, Abdulla Alhassa, David J Bloomfield, Charlie Chan, Mark Chinn, Susan Cleator, Charlotte E Coles, Andrew Goodman, Adrian Harrett, Penelope Hopwood, Anna M Kirby, Cliona C Kirwan, Carolyn Morris, Zahal Nabi, Elinor Sawyer, Navita Semaiah, Liba Stones, Isabel Syndikus, Judith M Bliss†, John R Yarnold†, on behalf of the FAST-Forward Trial Management Group

	Week 1	Week 2	Week 3	Week 4	Week 5	Total dose	Fractionation
Standard fractionation						50 Gy	2 Gy × 25
RMH/GOC						39 Gy	3 Gy × 13
						40 Gy	3.3 Gy × 13
						41 Gy	3 Gy × 13
						42 Gy	3.2 Gy × 13
						43 Gy	2.67 Gy × 15
						44 Gy	2.66 Gy × 16
						45 Gy	2.66 Gy × 16
						46 Gy	2.66 Gy × 16
						47 Gy	2.66 Gy × 16
						48 Gy	2.66 Gy × 16
						49 Gy	2.66 Gy × 16
						50 Gy	2.66 Gy × 16
UK FAST						30 Gy	5.7 Gy × 5
FAST-Forward						26 Gy	5.2 Gy × 5
						27 Gy	5.4 Gy × 5

# Why research/Clinical trial

**Before Writing Phase:** Feasibility, Study Aims, and Methodology

**FINER**

Feasible

Interesting

Novel

Ethical

Relevant

# Why research/Clinical trial

- **Before Writing Phase: Feasibility, Study Aims, and Methodology**

1. “What are the aims of the study?”

2. “Why, Where and How the study should be conducted?”

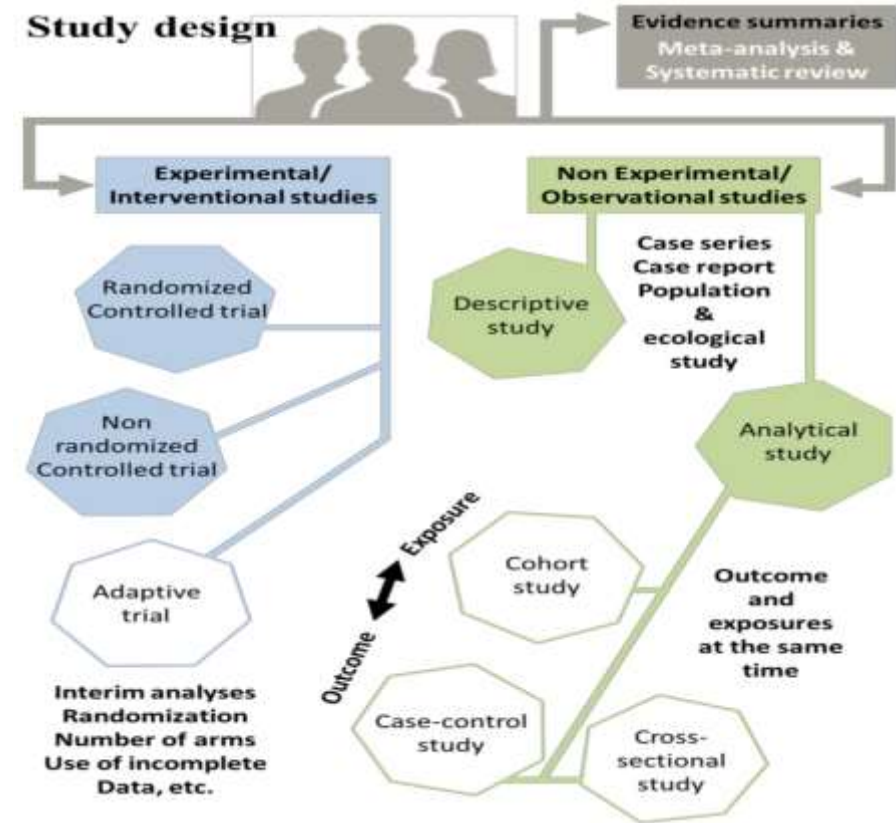

# Hypothesis/research question

- Most Important
- SMART
  - Specific
  - Measurable
  - Achievable
  - Relevant
  - Time-frame

# What type of trial/Design of trial

# Randomized trial: Game of number

Trial Design	Interpretation
Superiority	Intervention > Control
Equivalence	Intervention = Control  Eg a new drug is not “ <u>unacceptably different</u> ” compared to the standard
Non-inferiority	Intervention is not “ <u>unacceptably worse</u> ” than control  The new drug may be meaningfully less efficacious compared to the standard but that lost efficacy is acceptable to us!

Particular intervention may be **acceptably worse**

But has ancillary benefits over the control such as lower costs, lesser side effects, easier administration etc.

Smaller sample size

# Adaptive trial design

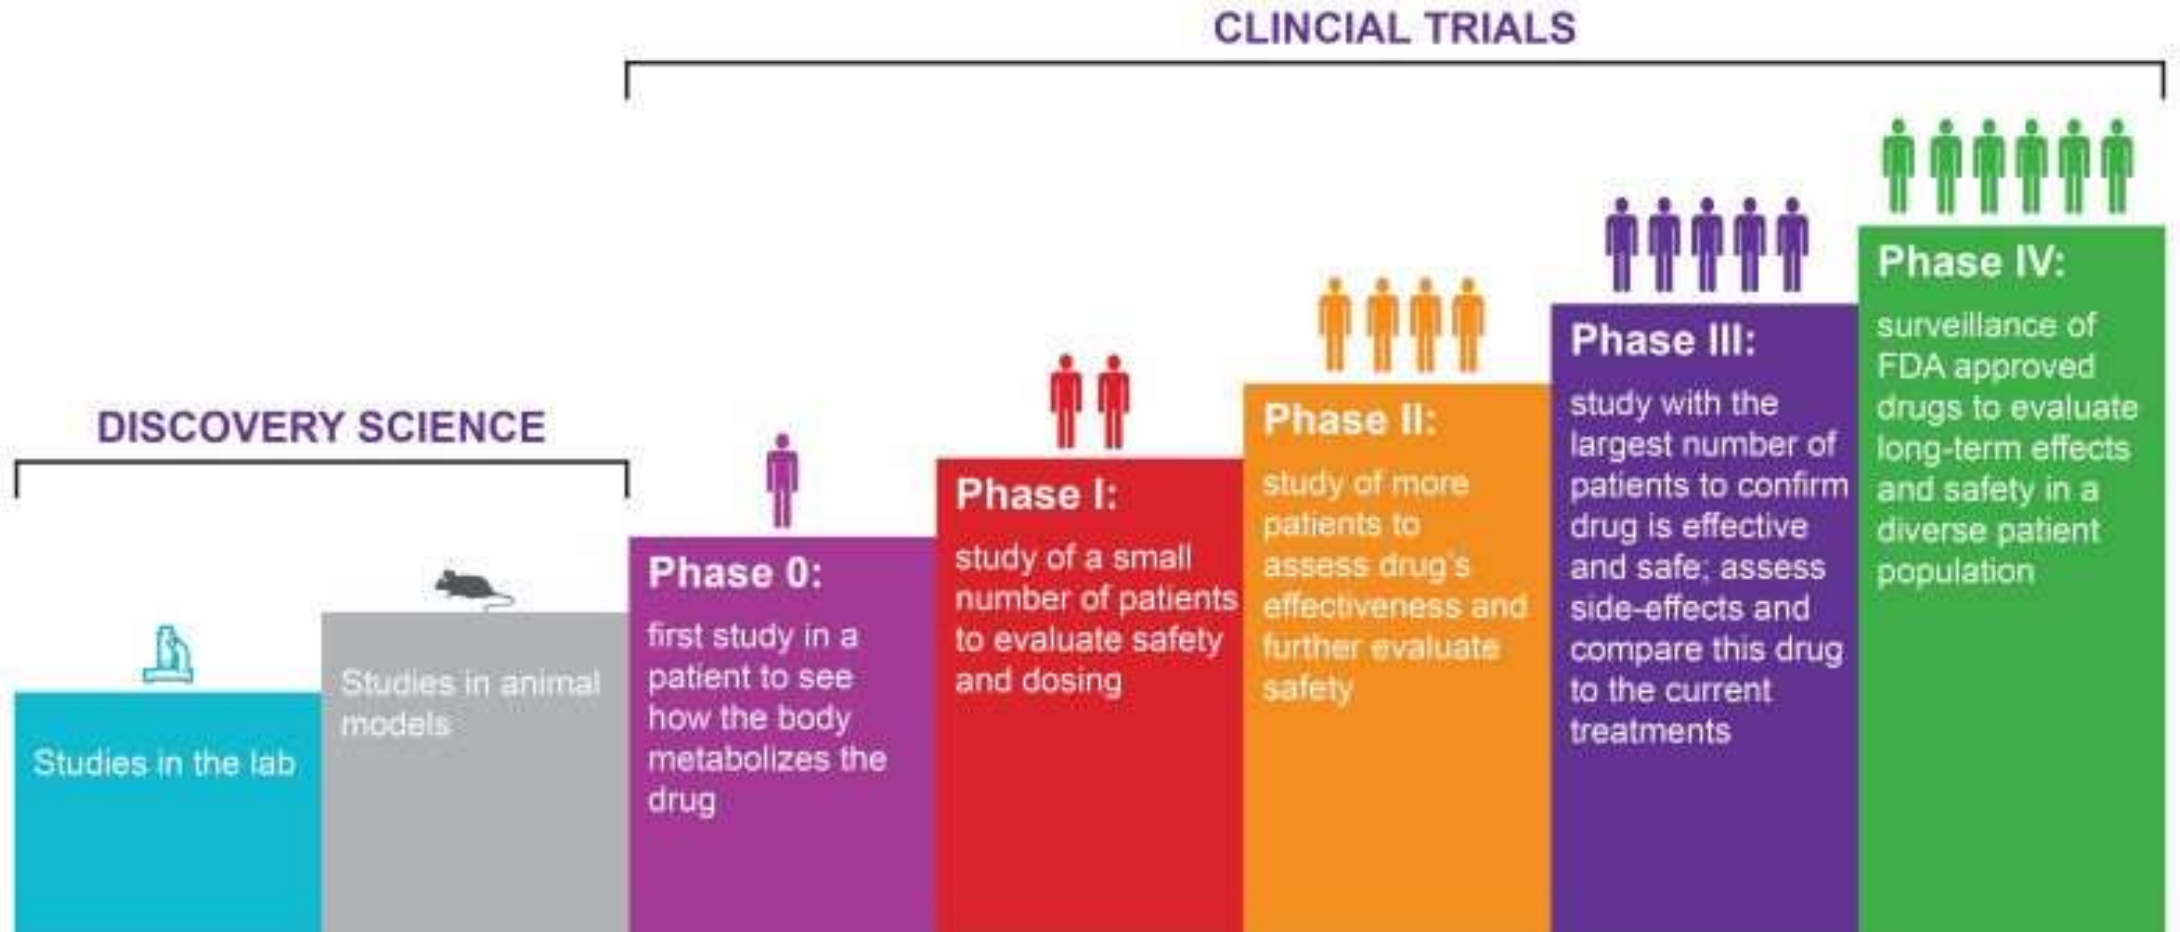

# Objective/ Define endpoint

- Endpoints are the gateway to answering a research question
- Number of endpoints
- Primary and secondary
- Single trial; Single Intervention

# Objective/ Define endpoint

# Inclusion/Exclusion

- Study participants have the characteristics that will make it possible for the researchers to accomplish the study's purpose
- Increase the likelihood of the study producing accurate, reliable, and reproducible results
- Help ensure the safety of participants
- **Inclusion criteria:** Prospective participants must have
- **Exclusion criteria:** Disqualify prospective participants
- Written using positive language, avoiding negative clauses

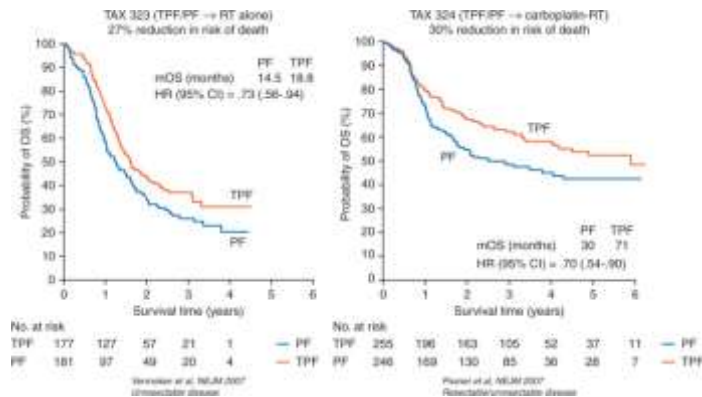

# Intervention and Comparator

## Radiotherapy plus Concomitant and Adjuvant Temozolomide for Glioblastoma

Induction chemotherapy followed by concurrent chemoradiotherapy (sequential chemoradiotherapy) versus concurrent chemoradiotherapy alone in locally advanced head and neck cancer (PARADIGM): a randomised phase 3 trial

Robert Haaland, Anne O'Neill, Guilherme Robinson, Roy Tahler, Fadi Khuri, Douglas Adams, Joseph Clark, Nicholas Sarlin, Jochen Lorch, Jonathan J. Beitler, Sewanti Limaye, Sarah Riley, Marshall Posner

**ONE ARM MUST BE: STANDARD OF CARE**

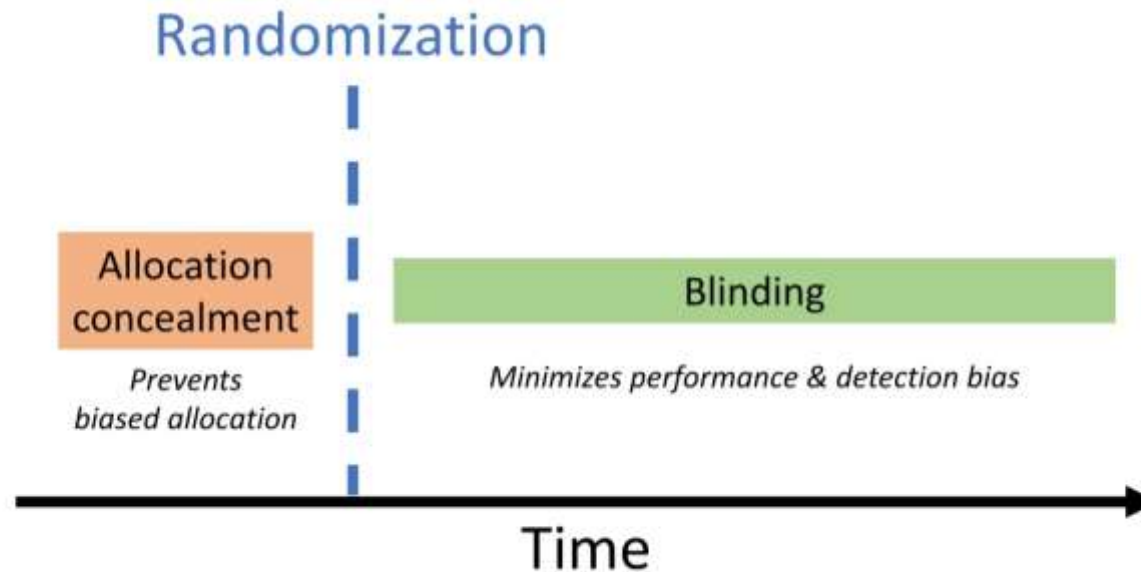

# Sample size calculation

- The estimation of sample size along with other study related parameters depends on Type I error, Type II error and Power
- Type I error = (Reject  $H_0$  /  $H_0$  is true).
- The probability of Type I error is called as level of significance ( $\alpha$ )
- Type II error = (Accept  $H_0$  /  $H_1$  is true)
- Probability of type II error is denoted as  $\beta$

# Blinding

- Blinding, or “**masking**”: Information that has the potential to influence study results is withheld from one or more parties

# Interim analysis

- Analysis of data that is conducted before data collection has been completed
- Decision on the type of analyses to conduct
- Data and Safety Monitoring Boards (DSMBs)

Type of interim analysis	Explanation	Justification for use
<b>Efficacy</b>	<ul style="list-style-type: none"><li>• Early termination of a trial that is showing promising results</li><li>• Control of type I error through group sequential methods or alpha-spending functions</li></ul>	<ul style="list-style-type: none"><li>• Usually for longer, larger studies and later phases of research</li><li>• Ethical imperative for a promising treatment to reach the entire target clinical population</li></ul>
<b>Futility</b>	<ul style="list-style-type: none"><li>• Early termination of a trial that is not likely to achieve the intended objective (e.g., little chance of finding a “significant” treatment effect at the end of the study)</li><li>• Employed through group sequential methods, error-spending functions, conditional power, or predictive power</li></ul>	<ul style="list-style-type: none"><li>• Reduces costs, resources, and patient burden for a trial with a low probability of “success”</li><li>• Usually for mid-late-phase studies</li><li>• Helpful in the context of recruitment and retention challenges</li></ul>
<b>Safety</b>	<ul style="list-style-type: none"><li>• Early termination (or pausing) of a trial for safety concerns</li><li>• Should be coupled with efficacy analyses to evaluate the benefit-to-risk ratio</li></ul>	<ul style="list-style-type: none"><li>• Incorporated across all phases of research</li><li>• Particularly important for vulnerable populations and high-risk interventions with more “serious” outcomes (e.g., death)</li></ul>
<b>Sample size re-estimation</b>	<ul style="list-style-type: none"><li>• Reassessment of the sample size required to ensure adequate power using updated information from interim trial data</li><li>• Can be blinded or unblinded</li><li>• May not necessarily spend alpha</li></ul>	<ul style="list-style-type: none"><li>• Allows for interim look at assumptions (standard deviations, event rates, correlations, etc.)</li><li>• May be particularly useful for mid-late-phase studies</li></ul>

# Ethical aspect

**Respect for autonomy:** We must not interfere with the decisions of competent adults, and also actively

**Justice:** All individuals should have an opportunity to participate in research unless contraindicated and we must not impose unfair burdens.

**Beneficence:** We must be fair and correct in all our actions and must take positive steps to prevent harm.

**Non-maleficence:** We must not harm others: "First, do no harm", and wherever harm cannot be avoided, we must try to minimize the same.

**Explores the scientific novelty, rationality and relevance**

1. Justification for conducting the trial in the context of national priorities
2. Scientific merits of the research project and feasibility: Review of toxicological studies, laboratory and animal data
3. Technology transfer and capacity building at sites

**Soundness of the study design:**

*Inclusion-exclusion criteria, Sample size,*

*Randomization/ blinding procedures End-point assessment*

*Study procedures and follow-up schedule Pharmacy plan*

# Informed consent document

- Research Description
- Risk
- Benefits
- Alternatives
- Confidentiality
- Compensation
- Contacts
- Voluntary participation and withdrawal

Consent is an appeal or invitation to participate in a research study in simple, easy to understand, local language

Signature of the participant and a witness not a part of the study team

# Research methodology guideline

- Reference guidelines
  - Standard Protocol Items: Recommendations for Interventional Trials (SPIRIT) statement
  - ICH-GCP
- Reporting guidelines: Consolidated Standards of Reporting Trials (CONSORT)
- According to ICH E6 (R2):
  - A clinical trial protocol serves as a comprehensive document outlining
    - Objectives
    - Design
    - Methodology
    - Statistical considerations
    - Overall organization of a study

# Data collection

**Quality data collection**

# Statistics

- Poor p-value Interpretation: P-values do not provide direct information about the magnitude or clinical relevance of the effect
- Confidence intervals should always be reported to identify effect sizes that can be “ruled out”
- ITT principle is a fundamental concept in clinical trials but is frequently misunderstood. The ITT principle essentially states to “analyze as randomized, Not PP
- Missing data is one of the biggest threats to the integrity of a clinical trial
- Consider testing only important hypotheses to reduce the possibility of false conclusions
- Subgroup analyses should generally be considered exploratory analyses rather than confirmatory. It is advisable to pre-specify subgroup analyses to avoid “data dredging”
- Appropriate reporting of clinical trial results is crucial for scientific advancement. Selective reporting is very common and can result in sub-optimal patient care
- Bayesian statistics, allows calculation of the probability of a hypothesis being true given the data.

# Building blocks for research

“**Building blocks**” encompass essential components

- Scientific methodology
- People-management skills
- Ethics and regulatory compliance
- Financial dynamics
- Participant recruitment
- Information technology and systems
- Institutional commitment

The entire process adheres to the comprehensive guidelines outlined by **EQUATOR**
